GE23131-Programming Using C-2024

Complete the function fourthBit in the editor below.

fourthBit has the following parameter(s):
int number: a decimal integer

Returns:
int: an integer 0 or 1 matching the 4th least significant digit in the binary representation of number.

Constraints

0 ≤ number < 2³¹

Input Format for Custom Testing

Input from stdin will be processed as follows and passed to the function.

The only line contains an integer, number.

Sample Case 0

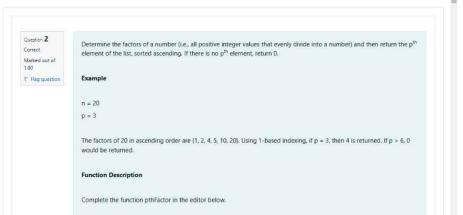

REC-CIS

GE23131-Programming Using C-2024

REC-CIS

```
10 - n = 10
5 - p = 5

Sample Output 1

0

Explanation 1

Factoring n = 10 results in (1, 2, 5, 10). There are only 4 factors and p = 5, therefore 0 is returned as the answer.

Sample Case 2

Sample Input 2

STDIN Function

1 - n = 1

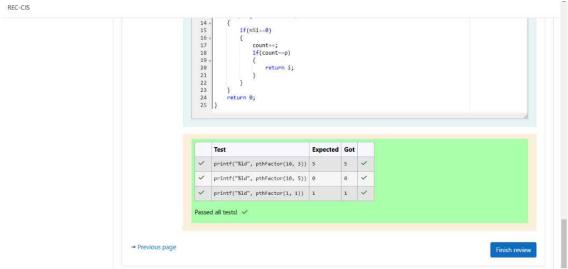

1 - p = 1
```

Sample Output 2

3

Explanation 2

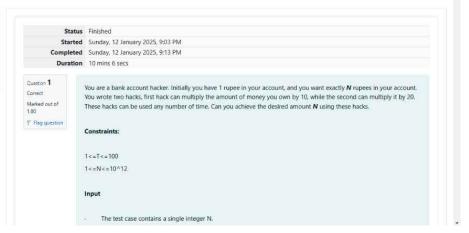

Factoring n = 1 results in (1). The p = 1st factor of 1 is returned as the answer.

REC-CIS

GE23131-Programming Using C-2024

Output

For each test case, print a single line containing the string "1" if you can make exactly N rupees or "0" otherwise.

SAMPLE INPUT

1

SAMPLE OUTPUT

2

SAMPLE OUTPUT

0

Question 2
Correct
Marked out of 1.00
P. Flag question

Find the number of ways that a given integer, X, can be expressed as the sum of the N^{th} powers of unique, natural numbers.

For example, if X = 13 and N = 2, we have to find all combinations of unique squares adding up to 13. The only solution is $2^2 + 2^2$.

Function Description

Complete the powerSum function in the editor below. It should return an integer that represents the number of possible combinations.

powerSum has the following parameter(s):

X: the integer to sum to

N: the integer power to raise numbers to

Input Format

REC-CIS

Input Format

The first line contains an integer X.

The second line contains an integer N.

Constraints

 $1 \le X \le 1000$ $2 \le N \le 10$

Output Format

Output a single integer, the number of possible combinations calculated.

Sample Input 0

10

2

Sample Output 0

REC-CIS

1

Explanation 0

If X = 10 and N = 2, we need to find the number of ways that 10 can be represented as the sum of squares of unique numbers.

10 = 1² + 3²

This is the only way in which $\emph{10}$ can be expressed as the sum of unique squares.

Sample Input 1

100

75

Sample Output 1

13900 0000

```
Explanation 1

100 = (10^2) = (6^2 + 8^2) = (1^2 + 3^2 + 4^2 + 5^2 + 7^2)

Sample Input 2

100

3

Sample Output 2

1

Explanation 2

100 can be expressed as the sum of the cubes of 1, 2, 3, 4.

(1 + 8 + 27 + 64 = 100). There is no other way to express 100 as the sum of cubes.
```

```
Test

✓ printf("%d", powersum(10, 1, 2)) 1 1 ✓

Passed all tests! ✓
